Understanding and Responding to Adverse Childhood Experiences in the School Setting

Pamela Kahn, MPH, BS, RN
Coordinator, Health and Wellness
Lucy Vezzuto, Ph.D.
Student Mental Health, Social-Emotional Learning & School Climate
Orange County Department of Education,
Center for Healthy Kids & Schools

Our Focus
- The types of childhood trauma and what makes an experience traumatic.
- Brain development and the relationship between early adverse experiences and subsequent youth health and behaviors.
- What is the Adverse Childhood Experiences (ACE) Study?
- How educators can create a trauma-informed school with a multi-tiered system of support services
What is Trauma?
• The word “trauma” is used to describe experiences or situations that are emotionally painful and distressing, and that overwhelm people’s ability to cope, leaving them powerless. (Center for Nonviolence & Social Justice, 2016)

Trauma
• Prevalent in the lives of children.
• Affects learning and school performance, and causes physical and emotional distress.
• Children/teens experience the same emotions as adults, but may not have the words to express them.
• Schools have an important role to play in meeting the social/emotional needs of students
  ▪ Trauma sensitive schools help children feel safe to learn.

What Makes an Experience Traumatic?
• Overwhelming, very painful, very scary
• Fight or Flight incapacitated
• Threat to physical or psychological safety
• Loss of control
• Unable to regulate emotions
Trauma is the response to the event, not the event itself.
Understanding and Responding to Adverse Childhood Experiences in the School Setting

Acute Trauma

- Single incident (crime victim, serious accident, natural disaster)
- Treatment includes immediate support, removal from the scene of the trauma, use of medication for immediate relief of grief, anxiety, and insomnia, and brief supportive psychotherapy provided in the context of crisis intervention.

Complex Trauma

- Protracted exposure to protracted social and/or interpersonal trauma in the context of dependence, captivity or entrapment (e.g., chronic maltreatment, neglect or abuse in a caregiver relationship, hostages, prisoners of war, concentration camp survivors, and survivors of some religious cults).
- Often results in borderline or antisocial personality disorder or dissociative disorders.
- Behavioral difficulties (such as impulsivity, aggression, sexual acting out, eating disorders, alcohol or drug abuse, and self-destructive actions).
- Extreme emotional difficulties (intense rage, depression, or panic) and mental difficulties (fragmented thoughts, dissociation, and amnesia).
- The treatment of such patients often takes much longer, may progress at a much slower rate, and requires a sensitive and highly structured treatment program delivered by a team of trauma specialists.

Complex trauma

- Is chronic
- Begins in early childhood
- Occurs within the child's primary caregiving system and/or social environment
Prevalence of Youth Trauma

- 68% of children and adolescents experienced at least one potentially traumatic event by age 16.
- In one study, 78% of children reportedly had multiple adversities, with an average initial exposure at age 5 years.
- Data suggest that every classroom has at least one student affected by trauma.
- Students living in poverty, homelessness, and with other social vulnerabilities are significantly more apt to experience stress and trauma.

(Copeland, Keeler, Angold & Costello, 2007; Cook, Blaustein, Spinazzola, & Yehuda, 2005)

Trauma’s Impact on Brain Development

- Attachment: Trouble with relationships, boundaries, empathy, and social isolation.
- Physical Health: Impaired concentration, development, coordination problems, increased medical problems, and somatic symptoms.
- Emotional Regulation: Difficulty identifying or labeling feelings and communicating needs.
- Dissociation: Altered states of consciousness, amnesia, impaired memory.
- Cognitive Ability: Problems with focus, learning, processing new information, language development, planning, and orientation to time and space.
- Self-Concept: Lack of consistent sense of self, body image issues, low self-esteem, shame, and guilt.
- Behavioral Control: Difficulty controlling impulses, oppositional behavior, aggression, disrupted sleep, and eating patterns, intrusive images.

Physical Effects of Trauma on the Brain

[Image of healthy and injured brain]
### Trauma Impacts on Child Behavior

- Trauma causes the brain to adapt in ways that contributed to their survival (i.e., constant fight/flight/freeze).
- These adaptations can look like behavior problems in "normal" contexts, such as school.
- When triggered, "feeling" brain dominates the "thinking" brain.
- The normal developmental process is interrupted, and students may exhibit internalizing or externalizing behaviors.

### Common Triggers for Traumatized Children

- Unpredictability or sudden change
- Transition from one setting/activity to another
- Loss of control
- Feelings of vulnerability or rejection
- Confrontation, authority, or limit setting
- Loneliness
- Sensory overload (too much stimulation from the environment)

### Fight, Flight & Freeze; What do these Look Like in Children?

- **FIGHT**
  - Hyperactivity, verbal aggression, oppositional behavior, limit testing, physical aggression, “bouncing off the walls”
- **FLIGHT**
  - Withdrawal, escaping, running away, self-isolation, avoidance
- **FREEZE**
  - Stilling, watchfulness, looking dazed, daydreaming, forgetfulness, shutting down emotionally
Warning Signs

- Look for moments when the intensity of the child's response does not match the intensity of the stressor
- Or when a child's behaviors seem inexplicable or confusing. Consider—might the student's alarm system have gone off?
- Remember: the primary function of the triggered response is to help the child achieve safety in the face of perceived danger.

How Trauma Affects Learning

- Traumatic stress from adverse childhood experiences can undermine the ability to form relationships, regulate emotions, and impair cognitive functions.
- Hyper arousal, intrusion or constriction may interfere with processing of verbal/nonverbal and written information.
- Ability to organize material sequentially may be inhibited due to coming from a chaotic environment.
- Difficulty with classroom transitions.
- Problem solving from a different point of view, inferring ideas, or working in group/exhibiting empathy may result when students do not feel safe expressing a preference.

Children with toxic stress live their lives in fight, flight or fright (freeze) mode

- Students overloaded with stress hormones and unable to function appropriately can’t focus on schoolwork.
- They fall behind in school/fail to develop healthy relationships with peers or create problems with teachers or principals because they are unable to trust adults.
- With failure, despair, and frustration pecking away at their psyches, they find solace in food, alcohol, tobacco, methamphetamines, inappropriate sex, high-risk sports, and/or work.
- They don’t regard these coping methods as problems. They see them as a way to obtain relief and to escape from depression, anxiety, anger, fear and shame.
- In other words, a solution, not a problem.
The ACEs Study

- It was 1985, and Dr. Vincent Felitti was mystified. The physician, chief of Kaiser Permanente’s revolutionary Department of Preventive Medicine in San Diego, CA, couldn’t figure out why, each year for the last five years, more than half of the people in his obesity clinic dropped out. Although people who wanted to shed as little as 30 pounds could participate, the clinic was designed for people who were 100 to 600 pounds overweight.
- Almost all of the dropouts had been losing, not gaining, weight. It didn’t make sense. Why were people who were dropping pounds dropping out?

- In a careful study of 286 such patients, Dr. Felitti learned that many had been unconsciously using obesity as a shield against unwanted sexual attention, or as a form of defense against physical attack, and that many of them had been sexually and/or physically abused as children.
- Although obesity was conventionally viewed as the problem, it was often found to be the unconscious solution to other, far more concealed, problems.

ACEs Study Begins:

- Dr. Robert Anda, a medical epidemiologist at the CDC had been studying how depression and feelings of hopelessness affected coronary heart disease.
- Collaboration began between the CDC and Kaiser Permanente’s Health Appraisal Clinic in San Diego.
ACEs Study

• Retrospective approach examined the link between multiple types of childhood stressors and adult health for over 17,000 adult participants.
  • A questionnaire asked for detailed information on their past history of abuse, neglect and family dysfunction as well as their current behaviors and health status.
  • Took place between 1995 and 1997, CDC still tracking the medical status of the baseline participants.

ACE Study Key Concept

• Stressful or traumatic childhood experiences can result in social, emotional, and cognitive impairments.
  • Fear-based childhoods disrupt neurodevelopment, and can actually alter normal brain structure and function.

The ACE Study Pyramid
Three Types of ACEs

What is an ACE Score?

- An ACE score is a tally of different types of abuse, neglect, and other hallmarks of a rough childhood.

- According to the Adverse Childhood Experiences study, the rougher your childhood, the higher your score is likely to be and the higher your risk for later health problems.

ACE Score

- The ACE score is the total number of ACEs that each participant reported.

  - For example, experiencing physical neglect would be an ACE score of one; if the child also witnessed a parent being treated violently, the ACE score would be two.

  - Given an exposure to one category, there is an 80% likelihood of exposure to another.
Understanding and Responding to Adverse Childhood Experiences in the School Setting

ACEs Increases Health Risks

The ACE Questionnaire

Prior to your 18th birthday:

- Did a parent or other adult in the household often or very often... Swear at you, insult you, put you down, or humiliate you? or Act in a way that made you afraid that you might be physically hurt?
  No___IfY es, enter 1

- Did you often or very often feel that... No one in your family loved you or thought you were important or special? or Your family didn't look out for each other, feel close to each other, or support each other?
  No___IfY es, enter 1

- Was a biological parent ever lost to you through divorce, abandonment, or other reason?
  No___IfY es, enter 1

The ACE Comprehensive Chart

<table>
<thead>
<tr>
<th>Column 1</th>
<th>Column 2</th>
<th>Column 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adverse Childhood Experiences</td>
<td>Neurobiological Impacts and Health Risks</td>
<td>Long-Term Health and Social Problems</td>
</tr>
</tbody>
</table>

The more types of adverse childhood experiences, the greater the neurobiological impacts and health risks, the more serious the lifelong consequences to health and well-being.
More than half of adolescents have had at least one of these adverse childhood experiences, and nearly one in ten have experienced four or more.

ACE and Risky Behaviors

- The higher the ACE score, the more we see risky health behaviors in childhood and adolescence including:
  - Pregnancies
  - Suicide attempts
  - Early initiation of smoking
  - Sexual activity
  - Illicit drug use
Understanding and Responding to Adverse Childhood Experiences in the School Setting

ACE Exposure and Education

- As early as the 1960's research established direct connections between childhood disadvantage and diminished educational outcomes.
  - Disparities in early-childhood experience produced disparities in cognitive skill – most significant in literacy - that could be observed on the first day of Kindergarten and well into adulthood.
- Among patients with an ACE score of 0, just 3% display learning/behavior problems.
- Among patients with a score of ≥ 4, the figure is 51%.*

What Can Schools Do?

Findings suggest that building resilience—defined in the survey as “staying calm and in control when faced with a challenge,” for children ages 6–17—can ameliorate the negative impact of adverse childhood experiences.

We recommend a coordinated effort to fill knowledge gaps and translate existing knowledge about adverse childhood experiences and resilience into national, state, and local policies…

Resilience

- Responsive caregiving provided to youth from trusted adults can moderate the effects of early stress and neglect associated with trauma
- Building resilience can counter the effects of trauma/ACE's and help lead youth to more effective, productive and healthy adulthoods
Schools Play A Critical Role In Supporting Students

- Many students experience serious stress or adversity at some point during their school careers.
- Many students have trauma histories that go unrecognized in school.
- Schools have an opportunity to provide a range of supports to students who experience stress or trauma through a multi-tiered system of supports approach.

(Rossen & Cowan, 2013)

Why Should Schools Be Trauma Informed?

- Children are more likely to access mental health services through primary care and schools than through specialty mental health clinics.
- Over 70% of students who do receive mental health services, receive those services in schools.
- Children with mental health disorders struggle in school and are less likely to succeed academically.

(Costello et al., 1998; Duchnowski, Kutash & Friedman, 2002; Mental Health America of Greater Houston, 2011; SRI International, 2015)

Using a “Trauma Lens”

A shift in perspective…

From “What is wrong with this student?”

To “What has this student been through?”
What might you notice about students?

Difficulty with…
- Organization
- Cause and effect
- Taking another’s perspective
- Attentiveness
- Regulating emotions
- Executive functions
- Engaging in the curriculum
- Transitions

What might you notice about students?

- Reactivity and impulsivity
- Aggression and defiance
- Withdrawal/avoidance
- Perfectionism
- Repetitive thoughts or comments about death or dying
- Non-age appropriate behavior
- Anxiety/worry about safety of self and others
- Poor or changed school performance and attendance
- Overly protective of personal space or belongings

Differential “State” Reactivity

<table>

<tr>
<td>Baseline</td>
<td>Stress</td>
<td>Extreme Stress</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Perry 2010
Danger and safety are the core concerns of traumatized children even in mostly safe places like school. Traumatic events outside school can generate distressing reminders in the hallway, in the classroom or anywhere on school grounds that interfere with a student’s ability to regulate their emotions and to learn. Protective factors, such as positive relationships with teachers and peers in schools can reduce the adverse impact of trauma. Trauma plays a major role among at risk and special populations: Children in the Child Welfare and Juvenile Justice Systems, Children in Special Education, LGBTQ Children, Children in Areas of Poverty, Gang Violence and Crime, Children with MH Challenges, etc.

Understanding Effects of Trauma On Children in Schools

What is a strategy you have employed in your work that supports youth who’ve experienced trauma?

What is something you learned from experience that DOES NOT work?
A Trauma-Informed School (TIS) Key Components

- Establishing a shared definition of a TIS
- Enhancing trauma awareness throughout the school community
- Conducting thorough assessment of school climate
  - Inclusiveness
  - Respect for Diversity
  - Identifying Risk Factors
  - Identifying Protective Factors
- Developing trauma-informed discipline policies
- Awareness of prevalence & impact of secondary traumatic stress on teachers and staff

Examples of Services and Programs

- Psychological First Aid: Listen Protect Connect
- Support to Students Exposed to Trauma (SSET)
- PBIS
- Restorative Practices
- Range of Activities – Student Interest Groups
- Community Internships
- Crisis Intervention
- Mental Health Services
- Threat and Risk Assessment teams
  - Intimidation and Bullying
  - Stalking
  - Relationship violence
  - Weapons possession
  - Suicidal behavior
  - Physical Assault

School-Based Mental Health Interventions

- Individual counseling services
- Safety/crisis planning
- Behavior plans
- Therapeutic & skill-building groups
- Youth development activities
- Case/Care management
Trauma-Informed Schools Require Broad Partnerships
- A partnered approach engages all stakeholders
- Implement components in a manner that fits within each schools’ unique organizational structure and culture

Safe and Supportive Schools Policy
Addresses disproportionality by eliminating suspensions based solely on “willful defiance” and replacing with integration of School-Wide Positive Behavior Interventions and Supports, Restorative Practices, Trauma-Sensitive Practices, and practices that address implicit and explicit bias.

Systematic School-Wide Response
- Staffing and funding
- Partnerships
- Tiered Wellness services
- Referral process
- Progress monitoring
- Safe and Supportive Schools’ Policy
Understanding and Responding to Adverse Childhood Experiences in the School Setting

Implications of Child Trauma for Teachers, Administrators & School Staff

- Trauma generated behaviors are complex but can be understood and addressed by educators
- A positive teacher-student relationship may take an investment of more time with a traumatized child.
- Student-teacher trust must be established before the process of teaching and learning can truly begin
- Working with trauma-exposed children can evoke distress in providers that makes it more difficult for them to teach and manage the classroom

Wong, 2013

How can school staff help?

Entire Classroom
- Establish classroom agreements for behavior
- Provide routines and consistency
- Provide explicit preparation for changes and transitions
- Create time in schedule for community building, circles, mindfulness
- Give opportunities for creative expression
- Teach about the power of mindsets

Individual & Groups of Students
- Build 1:1 relationships with struggling students
- 3:1 ratio of positive to negative
- Allow students to step outside of the classroom or put their head down
- Use restorative practices language
- Seat students near the front or near you

Mind-brain-body breaks
- Deep breathing
- Progressive relaxation
- Stretching or Movement
- Imagery
- Mindfulness
- Quiet Ball
- One-minute Dance Party
- Gonoodle.com

Vezzuto and Kahn, OCDE 19
How can the school environment help?
- Behavior Plans
- 1:1 counseling + consult
- Mental health referrals
- Student Study Teams
- Psycho-educational groups
- Referrals to on campus activities and services
- Mentoring programs
- Alternative to suspension programs
- Classroom presentations
- School-wide PBIS/Single School Culture
- Youth development programs
- Family events
- Entire staff professional development

UCSF HEARTS Approach to Addressing Chronic Stress & Trauma in Schools
- Psychotherapy for students + consultation with teachers; IEP consultation (5%)
- Care team meetings for at-risk students & school-wide issues; Trauma-informed discipline policies; Teacher wellness groups (15%)
- Building staff capacity: Training, consultation on trauma-sensitive practices; Promoting staff wellness; addressing stress, burnout, secondary trauma
- Partnering with staff for Universal Supports: Safe, supportive school climate; PBIS; Restorative Practices; Social-emotional learning curriculum; Health education on coping with stress (100%)

Dorado, 2015

How Can Schools Support Traumatized Students?
- Build relationships with struggling students
- Create a safe and predictable environment with clear, consistent rules
- Provide opportunities for students to meaningfully participate in class with some control & responsibility
- Embed mental health into the curriculum
- Check assumptions, observe, and question
- Be a model for appropriate behavior and relational skills
- Work with students to create a self-care plan to address triggers
After reviewing this research, is there something you would add to your toolbox? Something you would do differently?

Tips for Educators
- Coordinate efforts with others and make referrals
- Let students know you care by listening, empathizing, and providing structure
- Support and encourage participation in programs at your school that build relationships and student assets
- Offer ways for families to connect to your school
- Don’t make promises you can’t keep
- When you become aware of a student who has experienced trauma, ask for help

How to Respond When a Student Is Triggered...
- Breathe! Be calm and you will help the student be calm.
- Do not use this as a time to try to change behavior or demand respect.
- Call for help, or ask another person to call.
- Notice your tone of voice and personal space.
- Remember that the student is probably not engaged in the pre-frontal cortex right now!
Self-Care Is Critical

“It is not uncommon for school professionals who have a classroom with one or more students struggling from the effects of trauma to experience symptoms very much like those their students are exhibiting.”

The Heart of Learning and Teaching: Compassion, Resilience, and Academic Success
Seek Support Or Consultation If…
- You are dreaming about students' trauma, or can’t stop thinking about them.
- You are having trouble concentrating, sleeping, or are feeling more irritable.
- You feel numb or detached.
